

IMPORTANT!

A new DEP Regulation recently went into effect requiring sprinkler systems and any new builds have a backflow prevention device installed. The purpose of the backflow device and its testing is to insure that there is no cross-contamination of our water system.

To All Irrigation Customers: A backflow prevention device must be installed, at the owner's expense, on your irrigation system, in accordance with State and local regulations. A licensed plumber must obtain a plumbing permit through the Building Department.

Additionally, it is the owner's responsibility to have the backflow device tested annually by a licensed backflow tester.
